

Visualizing factor structures online with Radex

Michael Dantlgraber, and Ulf-Dietrich Reips

Outline

1) Introducing **Factor Based Radex Visualization (FBRV)**

2) Comparing traditional scales like

- **Locus of Control**
- **Self-Efficacy**
- **Excitement Seeking**

with the **Domain-Specific Risk-Taking Scale (DOSPERT)**

3) Online based network extensions

Traditional Visualization

Traditional Visualization

Traditional Visualization

Traditional Visualization

Traditional Visualization

Substantial disadvantage of the traditional visualization:

Further constructs can only be added left or right

Traditional Visualization

Traditional Visualization

the traditional visualization is not well suited for building a network of constructs

Online

Conclusion

The new visualization has some advantages compared with the traditional one.

Conclusion

The new visualization has some advantages compared with the traditional one.

- **Easier to combine different data sets**

Conclusion

The new visualization has some advantages compared with the traditional one.

- **Easier to combine different data sets**
- **Easier to build a network of constructs**

Conclusion

The new visualization has some advantages compared with the traditional one.

- **Easier to combine different data sets**
- **Easier to build a network of constructs**
- **Zoom in and out of constructs**

Conclusion

The new visualization has some advantages compared with the traditional one.

- **Easier to combine different data sets**
- **Easier to build a network of constructs**
- **Zoom in and out of constructs**
- **Emphasis on item pools of estimated factors**
